■ AXIS_REF for linking the PLC with the Axis

– definition of AXIS_REF

- AXIS_REF is an interface between the PLC and the NC. It is added to MC function blocks as axis reference.

```
VAR_GLOBAL CONSTANT
```

```
    // Number of Movers (Starting by 1)
```

```
    gciNumMovers      : INT := 5 ;
```

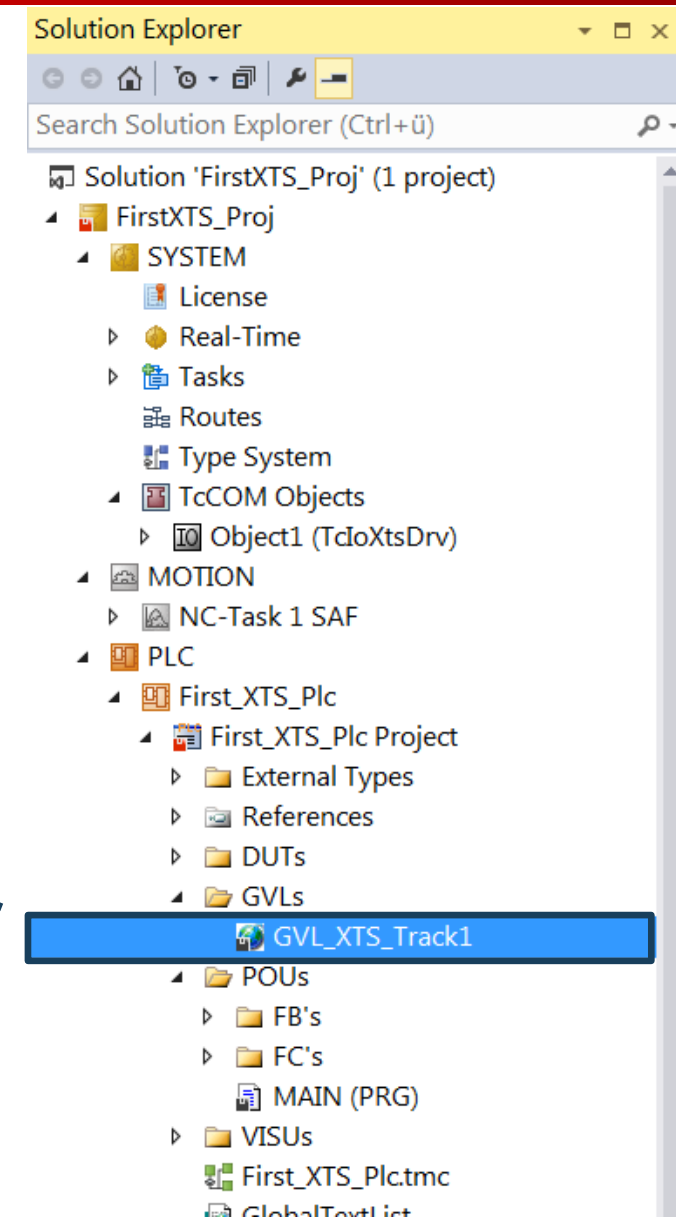

```
END_VAR
```

```

■ XTS-Utility PLC-Libraries

XTS-Utility PLC-Libraries contains

- DUTs
- GVLs
 - TcloXtsEnvironmentParameterList
- POU's
 - FB_TcloXtsEnvironment

TcIoXtsEnvironmentParameterList

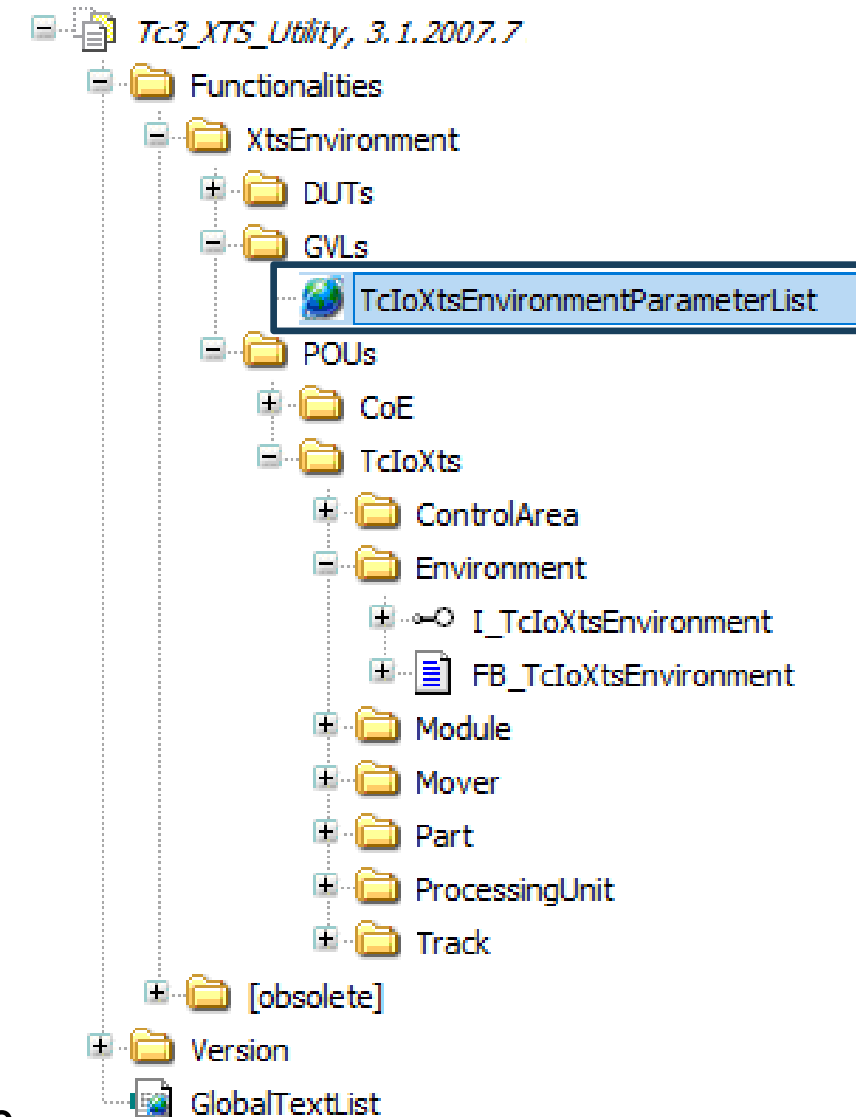

The constant list can be changed in the library.

TcIoXtsEnvironmentParameterList (PARAMS)

InOut:

Scope	Name	Type	Initial	Comment
Constant	MaxEtherCatMaster	UDINT	32	Maximum EtherCAT Masters used in one XTS
	MaxXtsProcessingUnits	UDINT	5	Number of XtsProcessingUnits used in this project
	MaxXtsPartsPerXpu	UDINT	10	Maximum number of XtsParts used under one XtsProcessingUnit
	MaxModulesPerPart	UDINT	128	Maximum number of XtsModules used for one XtsPart
	MaxAreasPerPart	UDINT	20	Maximum number of XtsAreas used for one XtsPart
	MaxXtsTracksPerXpu	UDINT	100	Maximum number of XtsTracks used under one XtsProcessingUnit
	MaxPartsPerTrack	UDINT	10	Maximum number of XtsParts used for one XtsTrack
	MaxXtsMoversPerXpu	UDINT	120	Number of XtsMovers used under one XtsProcessingUnit
	MaxXtsTasksPerXpu	UDINT	6	Number of XtsTasks used under one XtsProcessingUnit

The parameters must be adapted for the respective system

TcIoXtsEnvironmentParameterList

To change this Parameters

“Double-click” the entry within the library.

The screenshot shows the 'Bibliotheksverwalter' window for 'XTS_NewDriverSimulation'. The left pane shows a tree view with 'TcIoXtsEnvironmentParameterList' selected under 'TcIoXts'. The right pane shows the 'Parameter' table with the following data:

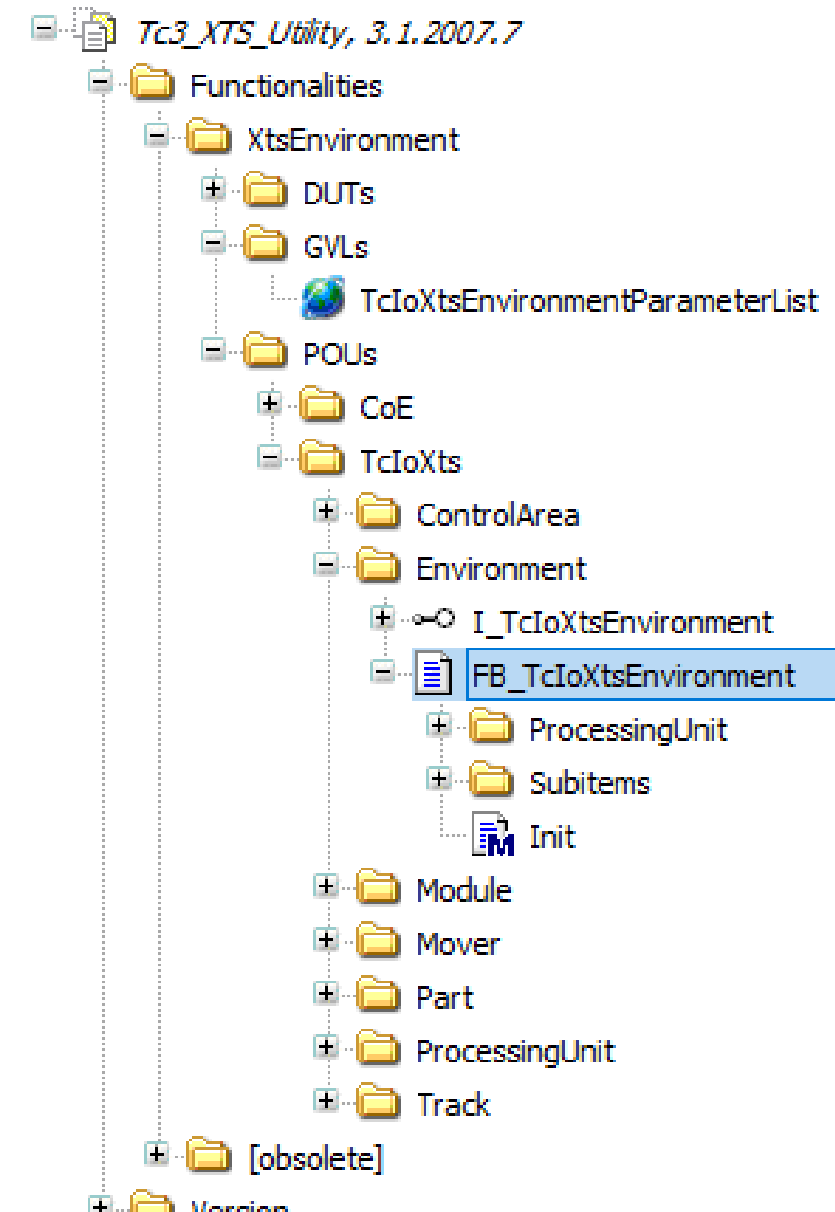

Name	Datentyp	Wert (editierbar)	Kommentar
MaxEtherCatMaster	UDINT	2	Maximum EtherCAT Masters used in one XTS
MaxXtsProcessingUnits	UDINT	1	Number of XtsProcessingUnits used in this project
MaxXtsPartsPerXpu	UDINT	1	Maximum number of XtsParts used under one XtsProcessingUnit
MaxModulesPerPart	UDINT	12	Maximum number of XtsModules used for one XtsPart
MaxAreasPerPart	UDINT	20	Maximum number of XtsAreas used for one XtsPart
MaxXtsTracksPerXpu	UDINT	100	Maximum number of XtsTracks used under one XtsProcessingUnit
MaxPartsPerTrack	UDINT	10	Maximum number of XtsParts used for one XtsTrack
MaxXtsMoversPerXpu	UDINT	120	Number of XtsMovers used under one XtsProcessingUnit
MaxXtsTasksPerXpu	UDINT	6	Number of XtsTasks used under one XtsProcessingUnit

The screenshot shows the 'Solution Explorer' window for 'First_XTS_Plc Project'. The tree view shows the following structure:

FB_TcIoXtsEnvironment

For easy gathering of XTS diagnostic data and accessing object parameters in the PLC.

FB_TcloXtsEnvironment

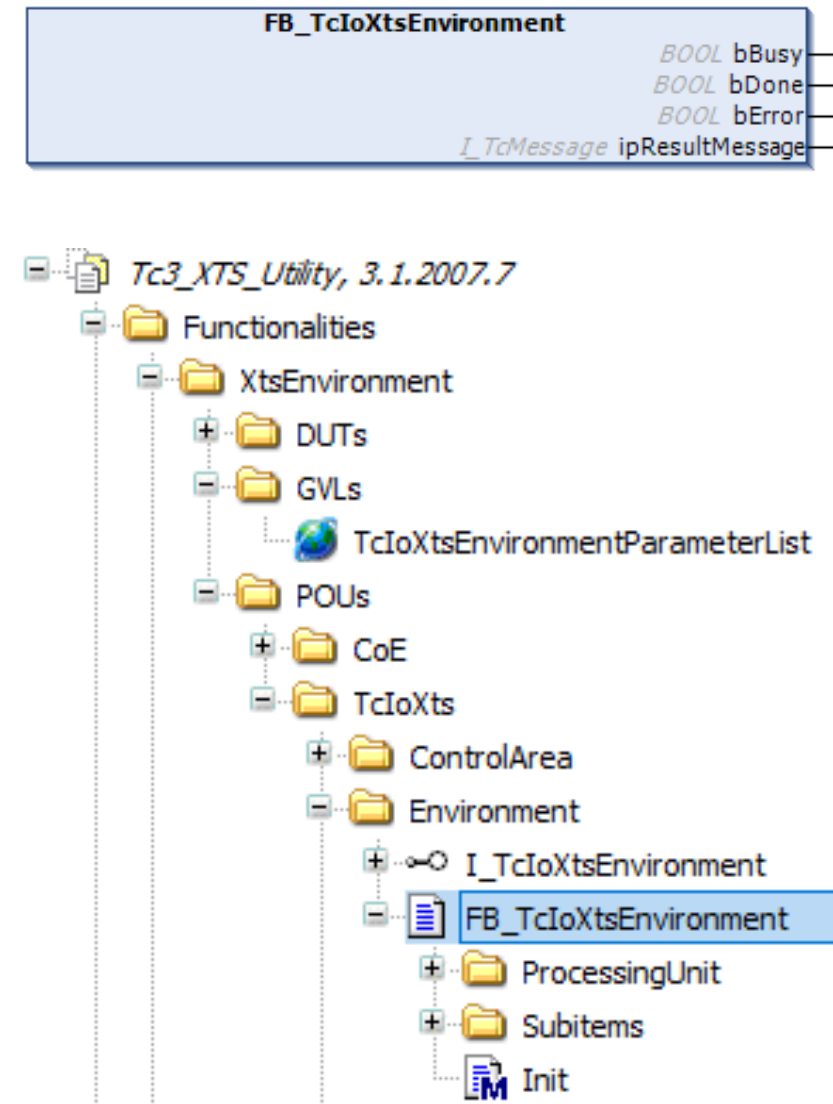

FB_TcloXtsEnvironment (FB)

FUNCTION_BLOCK FB_TcloXtsEnvironment IMPLEMENTS I_TcloXtsEnvironment

InOut:

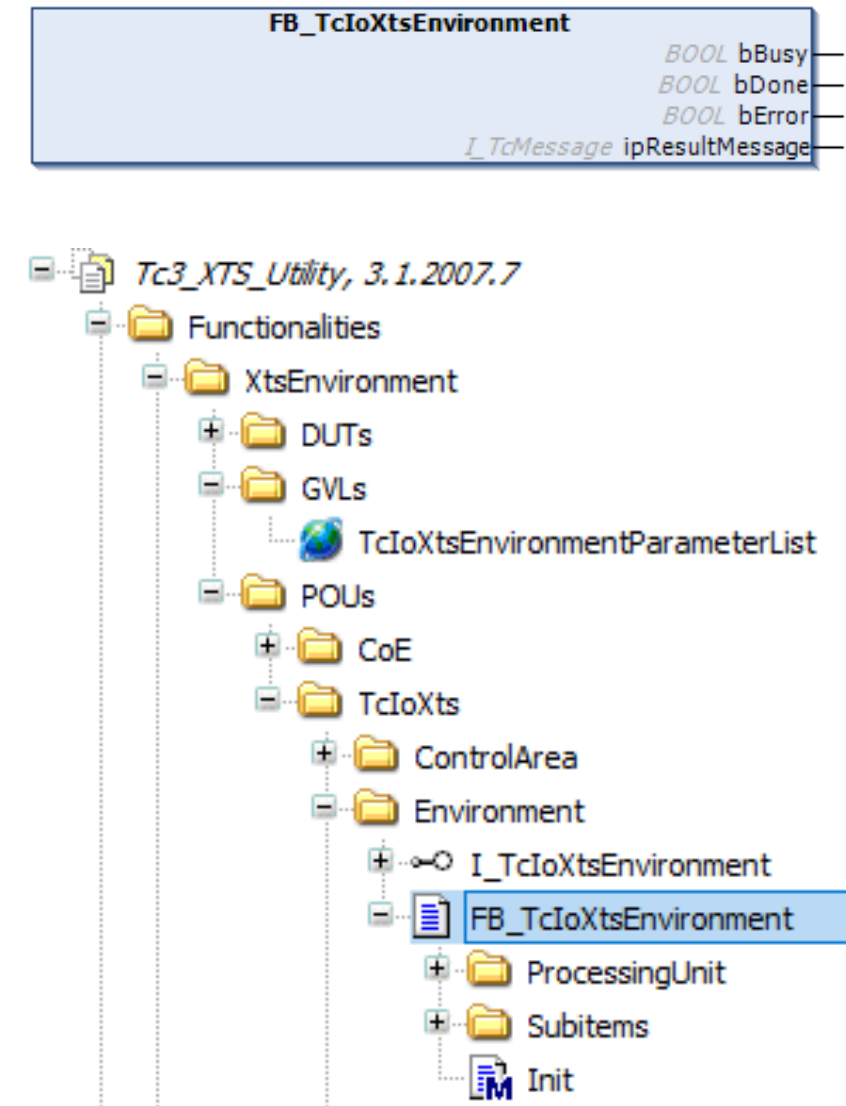

Scope	Name	Type	Initial
Output	bBusy	BOOL	
	bDone	BOOL	
	bError	BOOL	
	ipResultMessage	I_TcMessage	fbResult

- FB_TcloXtsEnvironment.Init (METH)
- ProcessingUnit
 - FB_TcloXtsEnvironment.GetXpuCount (METH)
 - FB_TcloXtsEnvironment.GetXpuOids (METH)
 - FB_TcloXtsEnvironment.P_XpuCount (PROP)
 - FB_TcloXtsEnvironment.P_XpuOids (PROP)
- Subitems
 - FB_TcloXtsEnvironment.XpuTclo (METH)

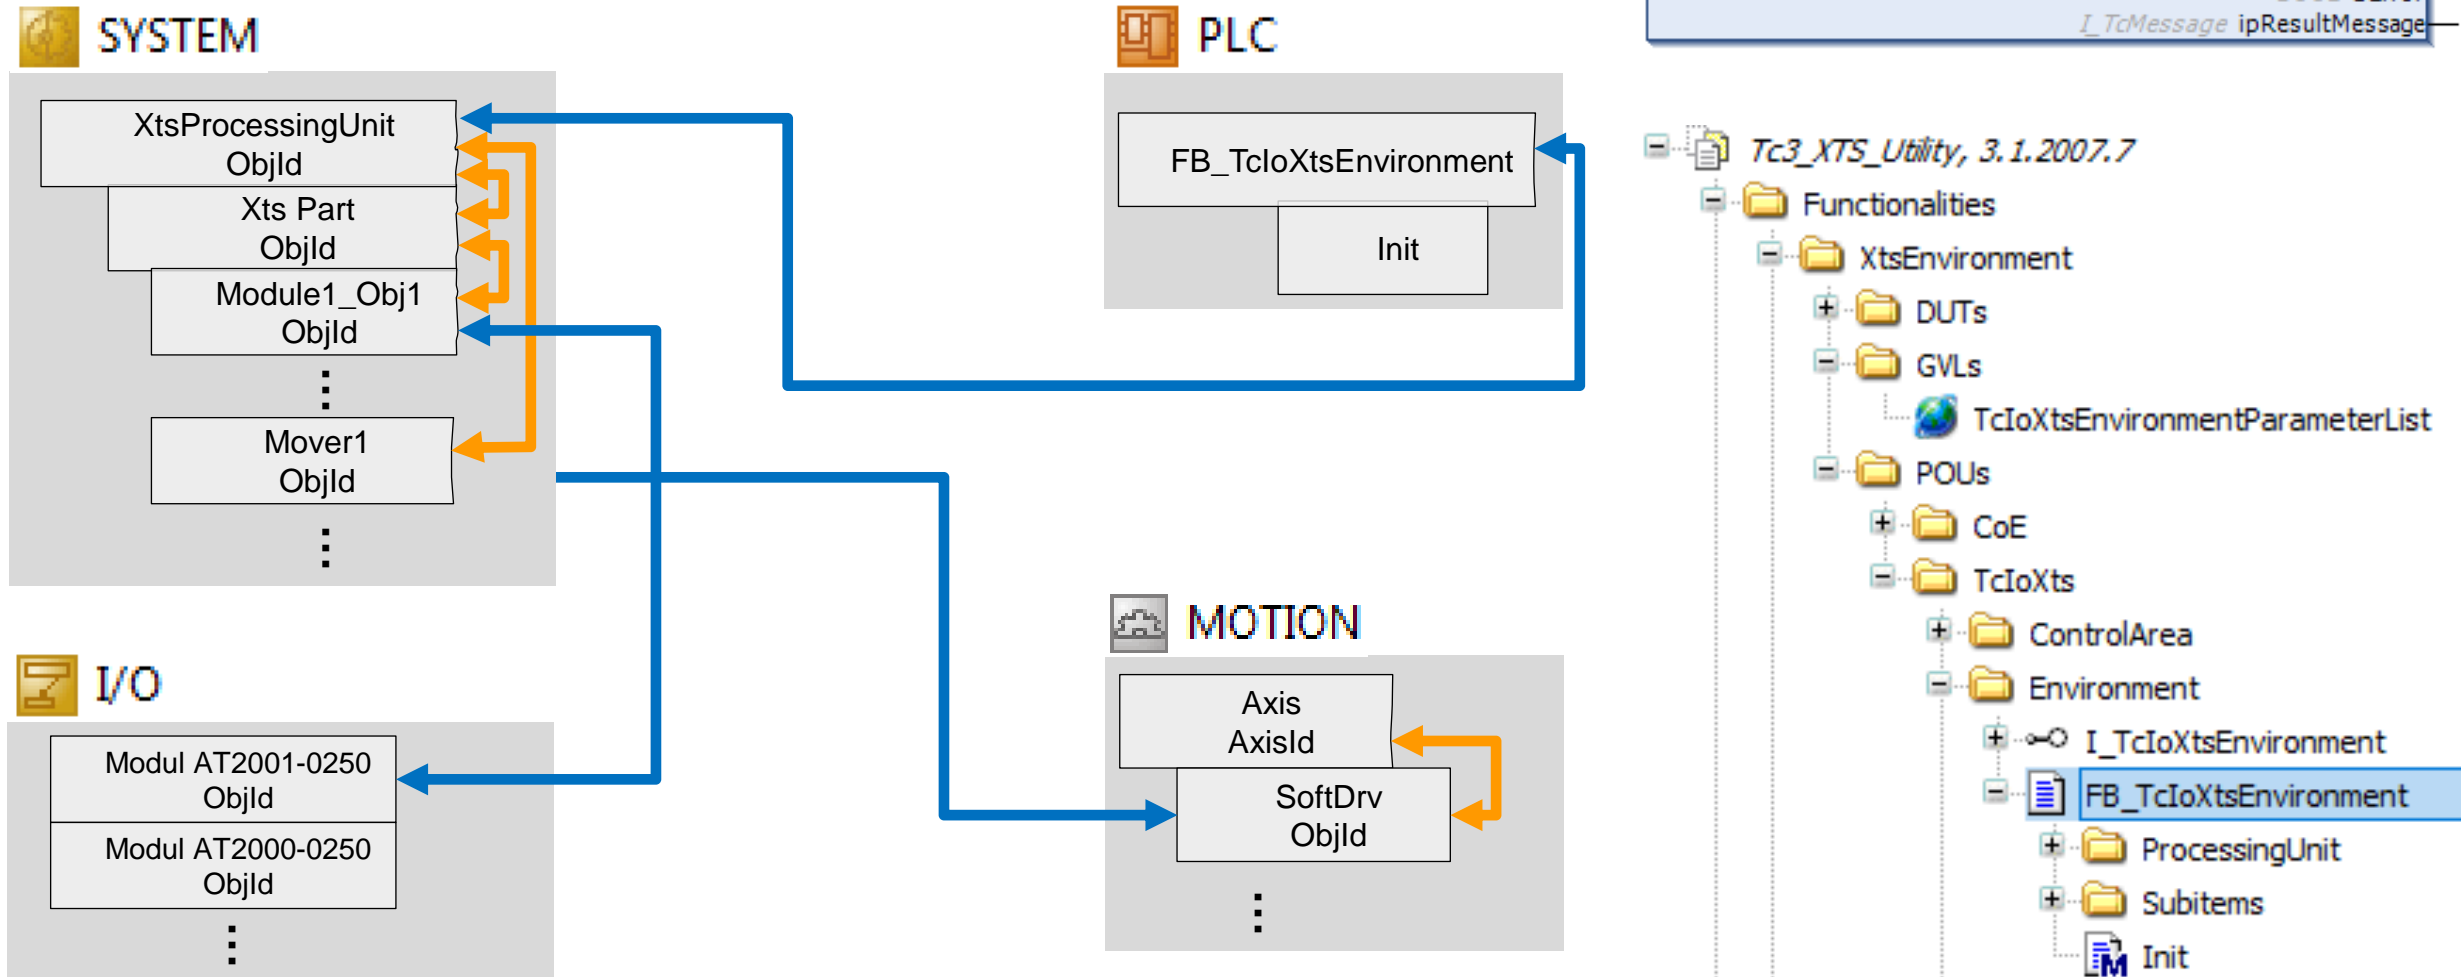

FB_TcIoXtsEnvironment

- only one FB_TcIoXtsEnvironment is needed the XTS project.
From this FB, all the XtsProcessingUnits and other objects can be accessed
- Once initialized, the Function Block have access to all the connected objects of the XtsEnvironment structure and their methods.
- There is no automatic cyclic update for data!
- The user can use the methods to get the required information if necessary.

Communication via FB_TcIoXtsEnvironment

FB_TcIoXtsEnvironment

- declaration

```
// XTS Utility
VAR_GLOBAL
    fbXtsEnvironment          : FB_TcIoXtsEnvironment;

    {attribute 'init_on_onlchange'}
    bInit                     : BOOL := FALSE;
END_VAR
```

- cal in Main()

```
// Cal FB_XtsEnvironment
// Trigger only once in init
IF NOT bInit THEN
    IF fbXtsEnvironment.Init(TRUE) THEN
        fbXtsEnvironment.Init(FALSE);
        bInit := TRUE;
    END_IF
END_IF

// If not yet initialized, don't execute any of the XtsUtility code
RETURN;
END_IF
```

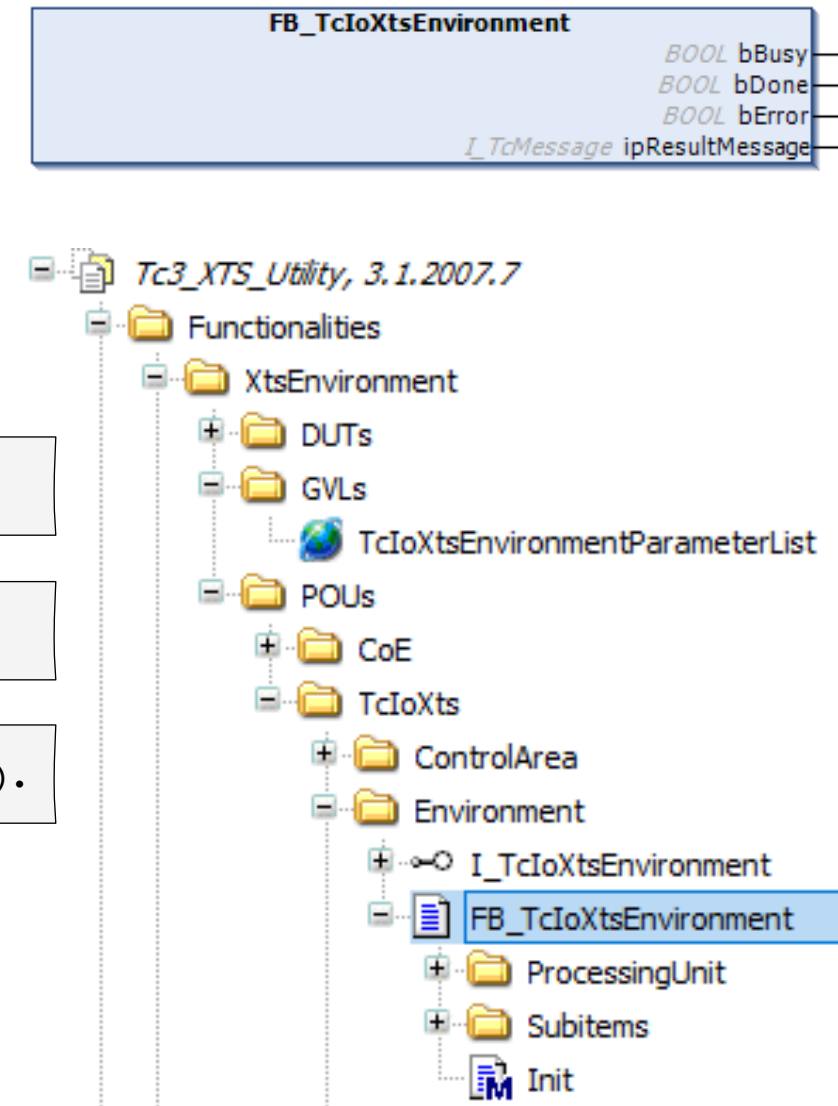

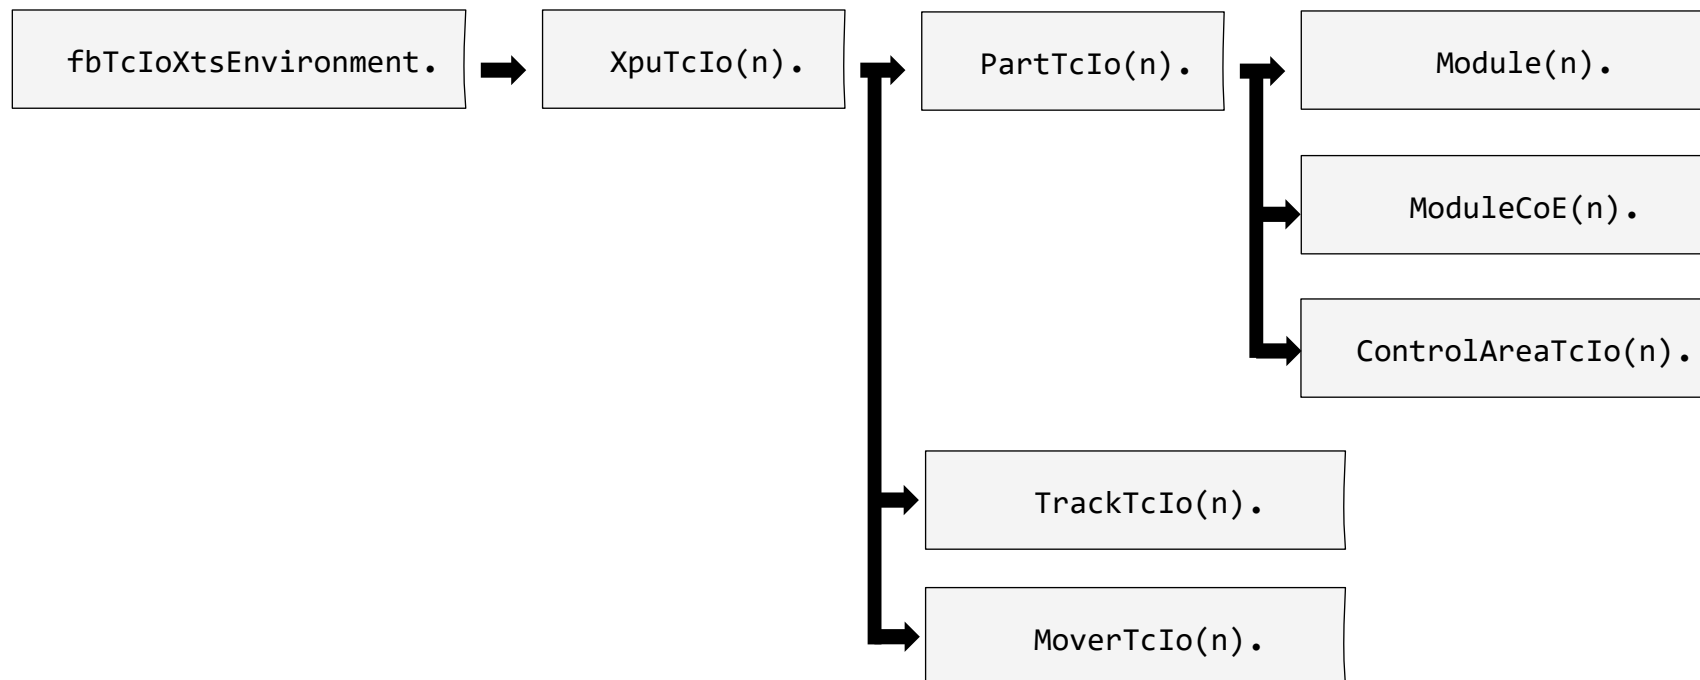

FB_TcIoXtsEnvironment

- The FB_TcIoXtsEnvironment is seen as a hub function block for all XTS related objects within the project.
- Each object has its respective function block (e.g. FB_TcIoXtsProcessingUnit) in the PLC. They can either be accessed via the FB_TcIoXtsEnvironment but also can be used standalone.

FB_TcIoXtsEnvironment

- To access the methods and gather the data easily, the below call chain can be followed which is very close to the actual object structure within the project:

Read/Write Parameter via FB_TcIoXtsEnvironment

read parameter

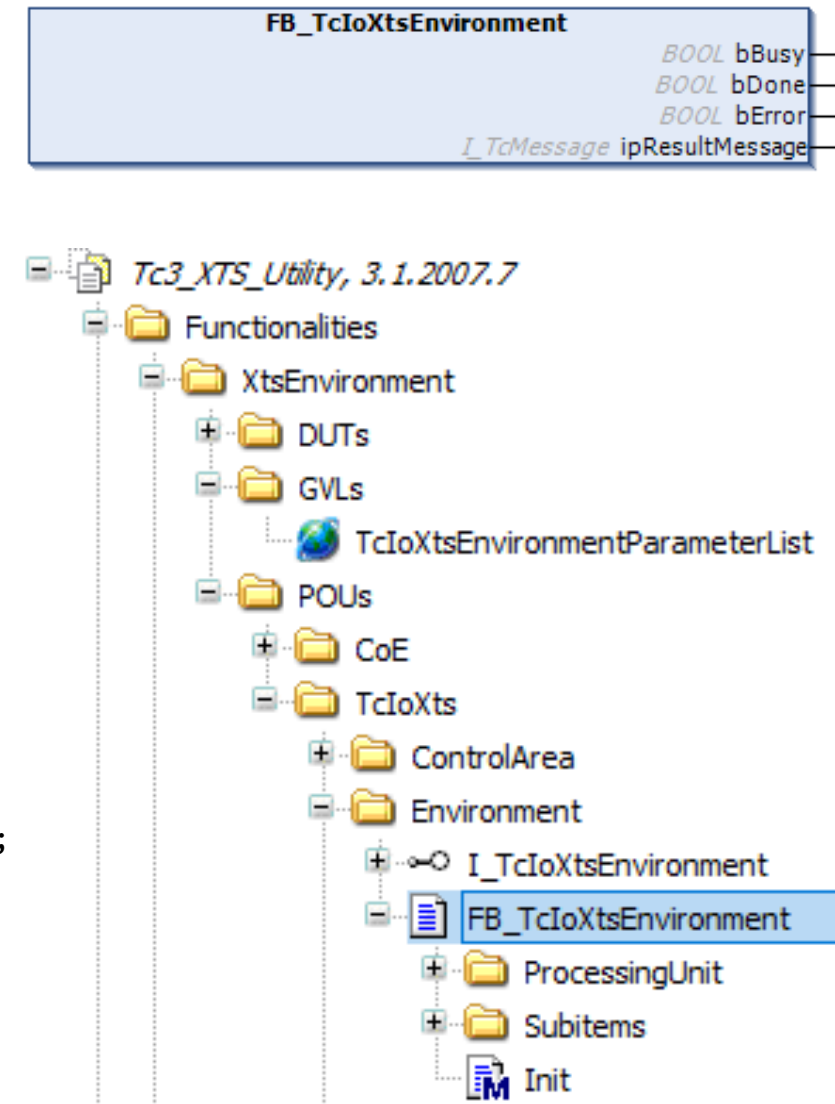

```
// Position valid
bAllPositionsValid :=
    fbXtsEnvironment.XpuTcIo(1).GetAreAllPositionsValid();
```

```
// Position valid
bTeachingValid:=
    fbXtsEnvironment.XpuTcIo(1).GetIsTeachingValid();
```

write parameter

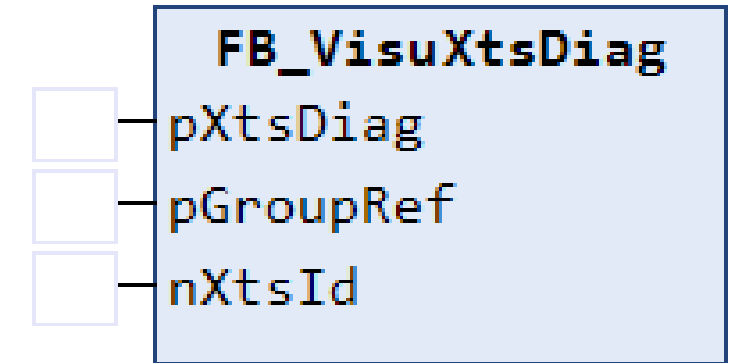

```
// Set ModuleOffset
fbXtsEnvironment.XpuTcIo(1).PartTcIo(1).ModuleTcIo(1).SetOffset(fNewModuleOffset);
```

METHOD SetOffset: BOOL
tc3_xts_utility, 3.1.2007.7 (beckhoff automation gmbh)
VAR_INPUT fOffset LREAL

▪ FB_VisuXtsDiag & VI_XTSLib

- FB_VisuXtsDiag
collect all necessary Information
from the XTS-Track
- VI_XtsLib
display all necessary Information
from the XTS-Track
inside of a PLC-Visualization (templet)

10. CA-Group handling
11. CA-Operation

▪ XTS- Start Up Condition

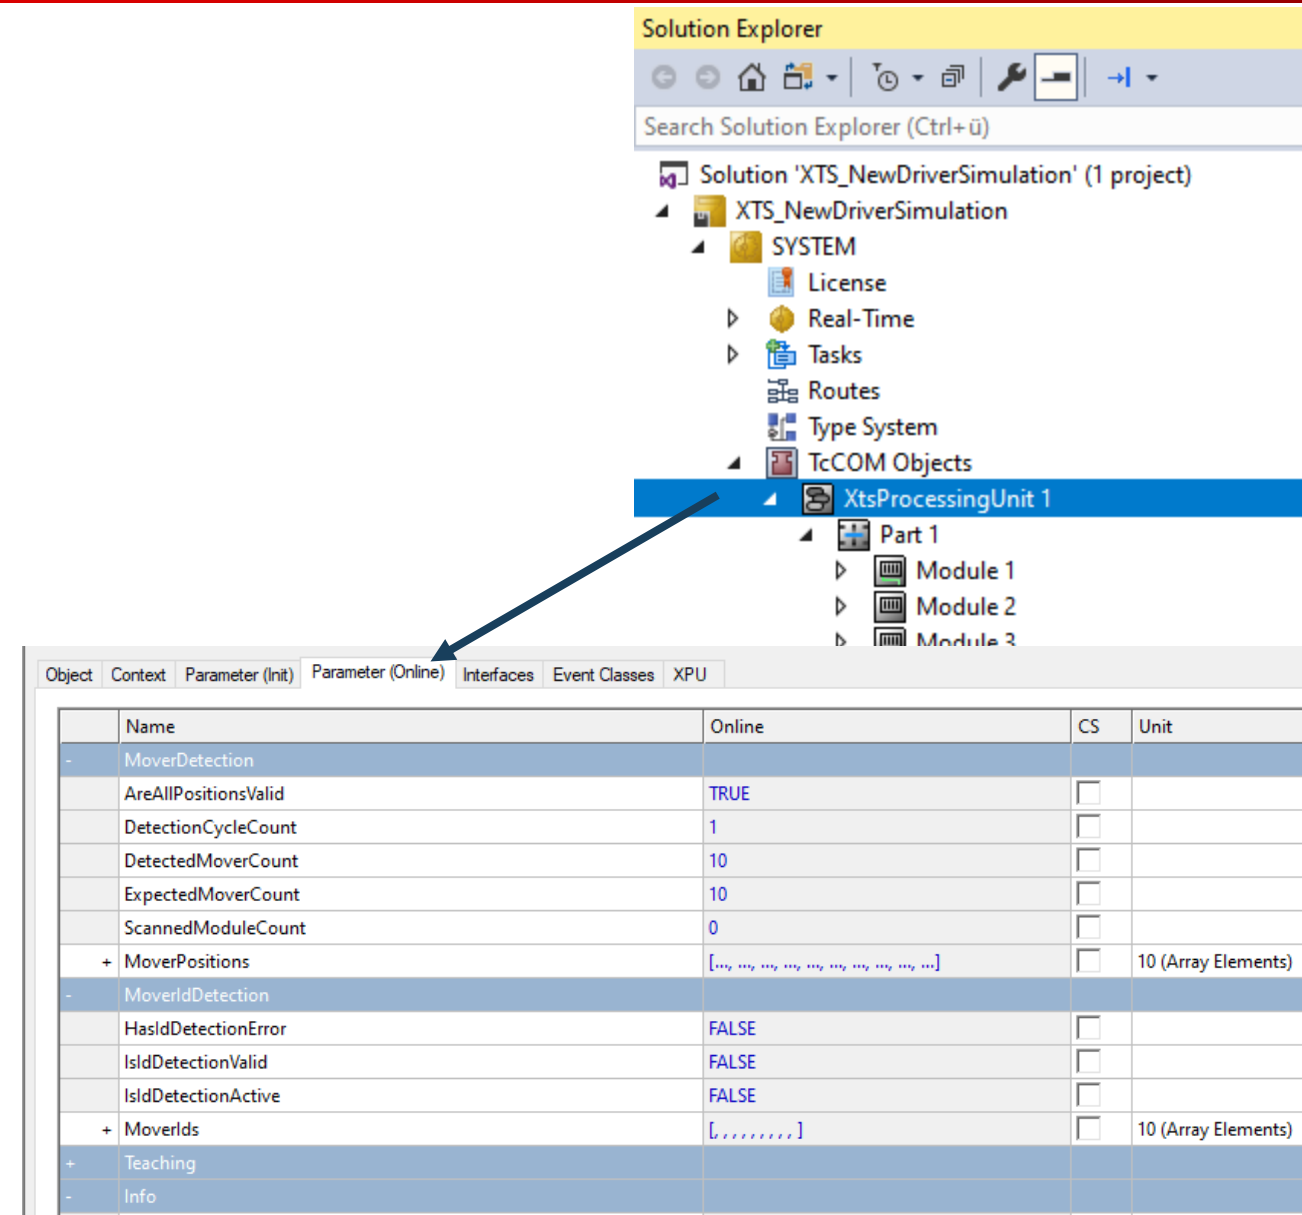

- The XTS I/O Driver requires time to find all of the movers on the track. During this process the XTS Task will exceed its cycle time, preventing the PLC Task from running normally.
- Therefore, the PLC program should not execute any logic until the XTS Task has successfully located all the configured movers

```
// Check if the position detection of the Movers has been completed.  
IF NOT fbXtsEnvironment.XpuTcIo(1).GetAreAllPositionsValid()  
  OR NOT fbXtsEnvironment.XpuTcIo(1).GetIsTeachingValid()  
  OR NOT ( fbXtsEnvironment.XpuTcIo(1).GetDetectedMoverCount() =  
           fbXtsEnvironment.XpuTcIo(1).GetExpectedMoverCount() ) THEN  
  // If not all Mover positions are valid, do not process any further.  
  RETURN;  
END_IF
```

XTS- StartUp Delay

- The actual state of the XTS-System are shown in “Parameter (Online)” for e.g.:
 - AreAllPositionsValid
 - DetectionCycleCount
 - DetectedMoverCount
 - ExpectedMoverCount
 - ScannedModuleCount

The screenshot shows the 'Solution Explorer' on the right, highlighting the 'XtsProcessingUnit 1' under 'TcCOM Objects'. An arrow points from this unit to the 'Parameter (Online)' tab in the main window. The table below lists the parameters and their current values.

	Name	Online	CS	Unit
-	MoverDetection

Collision Avoidance Overview

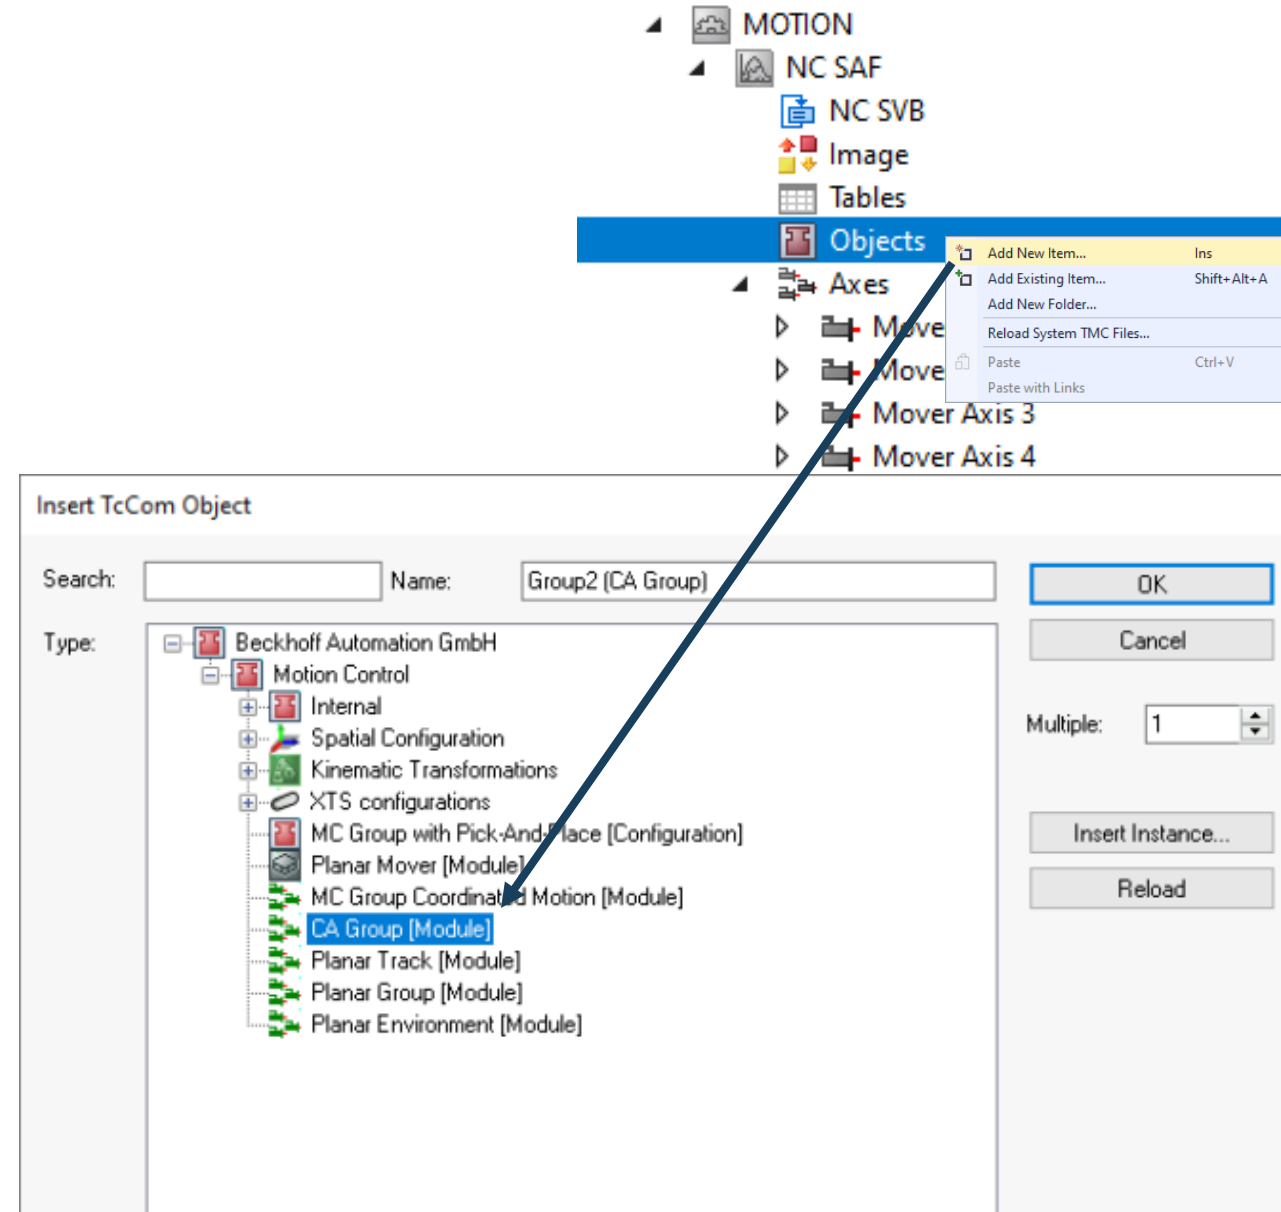

- The purpose of collision avoidance is to prevent collisions between movers, and also to maintain a parameterized “Gap” between any two movers.
- Therefor PTP axes are added to a CA (collision avoidance) group.
- Motion function blocks for collision avoidance are included in library Tc3_McCollisionAvoidance.
- Administrative function blocks are included in library Tc3_McCoordinatedMotion.
- For detailed collision avoidance information see the online Beckhoff Information System section on Advanced Motion

- Adding the CA Group Object

- Set the Context of the Collision Avoidance group to the NC-SAF Task

The screenshot displays the Beckhoff XTS software interface. At the top, a tree view shows the project structure: MOTION, NC SAF, NC SVB, Image, Tables, and Objects. The 'Objects' folder is expanded, showing 'Group1 (CA Group)' and 'Group Outputs'. A blue arrow points from 'Group1 (CA Group)' to the 'Context' tab of the configuration window below.

The configuration window has four tabs: Object, Context, Parameter (Init), and Data Area. The 'Context' tab is active, showing the following settings:

- Context: 0
- Depend On: Parent Object
- ☐ Need Call From Sync Mapping
- Data Areas:
 - ☒ 1 'Group Outputs'
 - ☒ 2 'Group Inputs'
- Interfaces: (empty)
- Data Pointer: (empty)
- Interface Pointer: (empty)

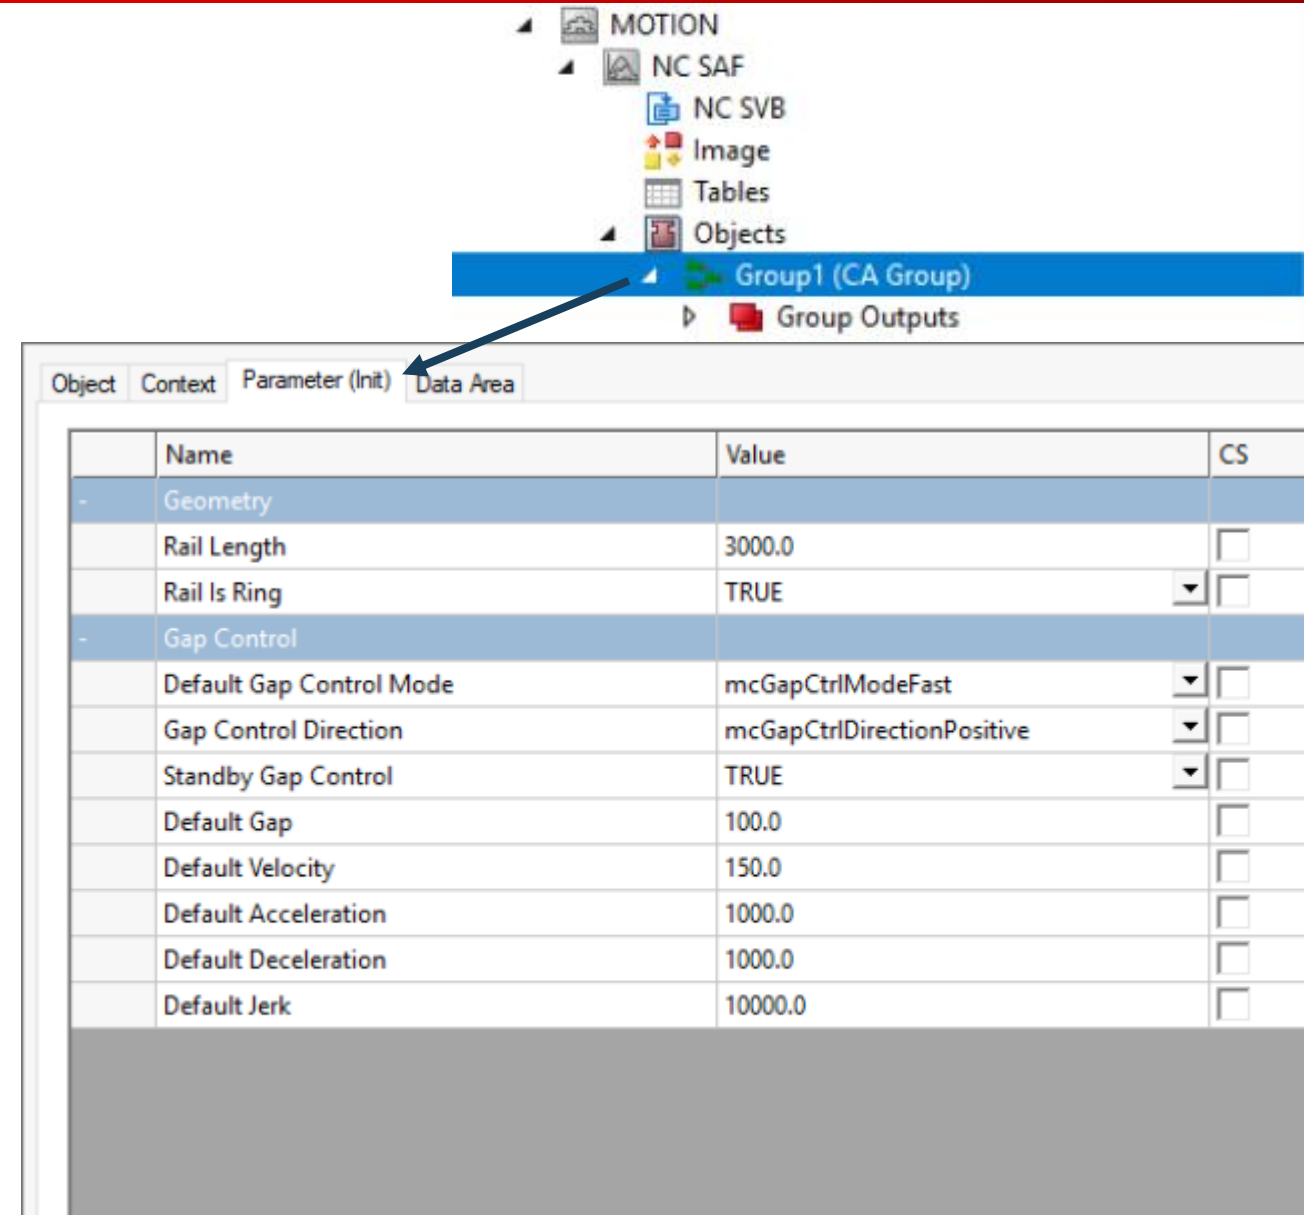

At the bottom, the 'Result' section shows a table with the following data:

ID	Task	Name	Prio..
0	05000010	NC SAF	4
1	05000020	NC SVB	8

Collision Avoidance Group Settings

The CA Group has 4 key settings.

- Rail Length
(Same as the HardwareModulo)
- Rail is a ring
- Gap Control Mode
 - mcGapCtrlModeStandard
 - mcGapCtrlModeFast
- Standby Gap Control

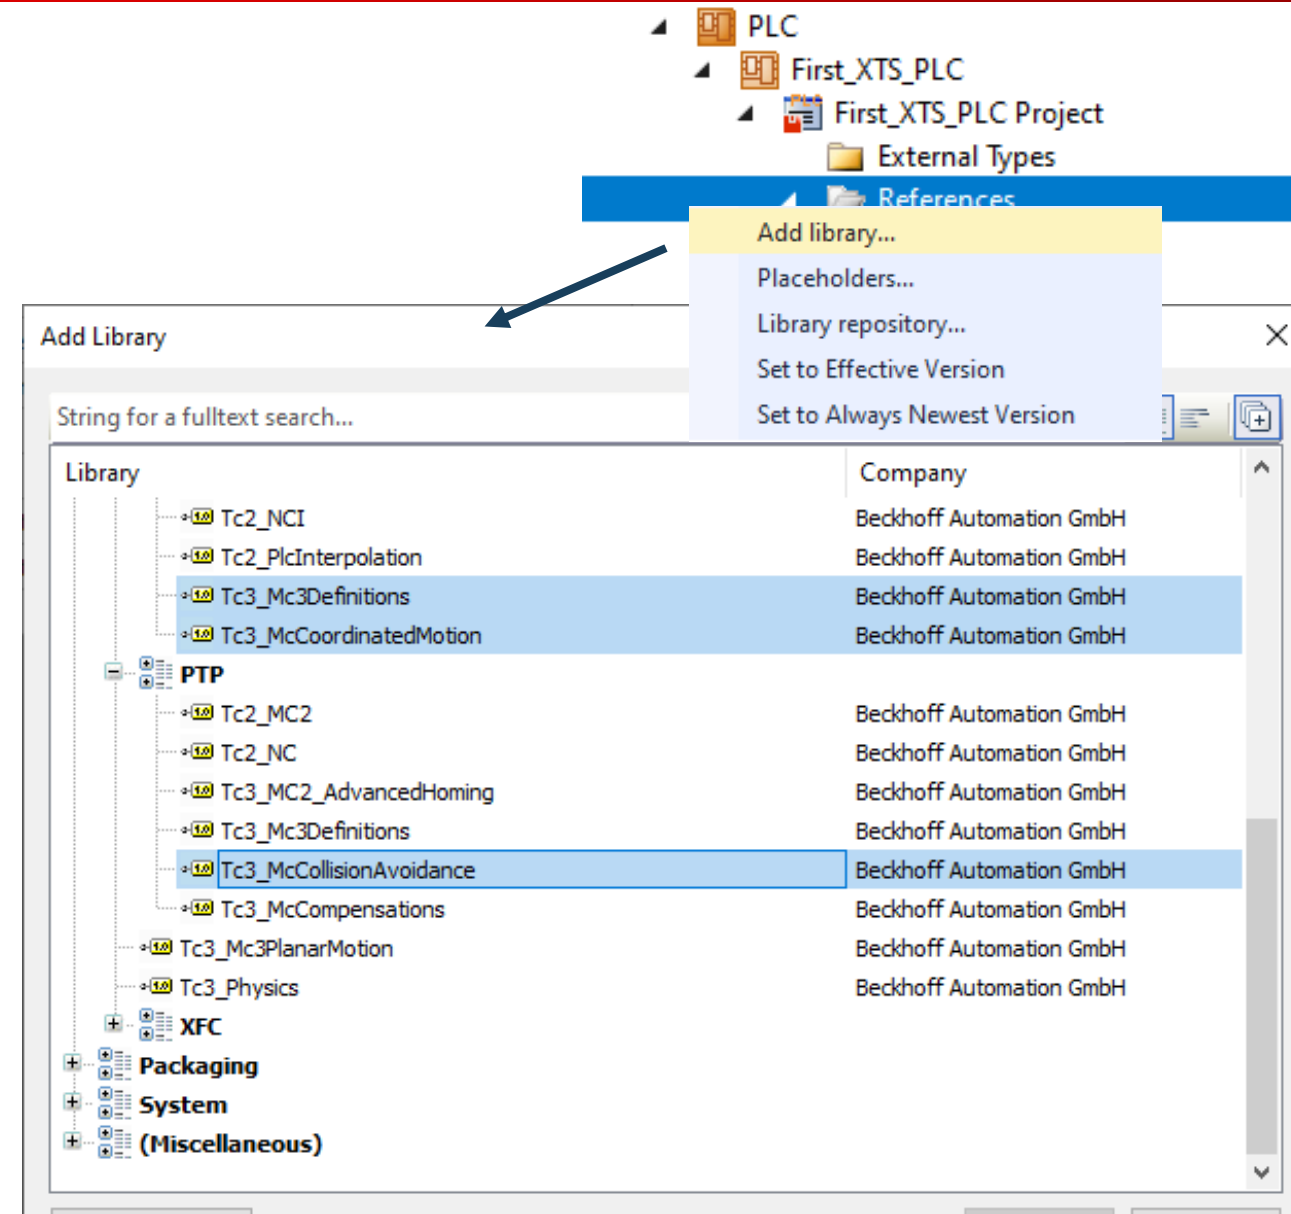

The screenshot shows the 'Data Area' tab of the 'Group1 (CA Group)' settings. The table below lists the parameters and their values:

Name	Value	CS
Geometry		
Rail Length	3000.0	<input type="checkbox"/>
Rail Is Ring	TRUE	<input type="checkbox"/>
Gap Control		
Default Gap Control Mode	mcGapCtrlModeFast	<input type="checkbox"/>
Gap Control Direction	mcGapCtrlDirectionPositive	<input type="checkbox"/>
Standby Gap Control	TRUE	<input type="checkbox"/>
Default Gap	100.0	<input type="checkbox"/>
Default Velocity	150.0	<input type="checkbox"/>
Default Acceleration	1000.0	<input type="checkbox"/>
Default Deceleration	1000.0	<input type="checkbox"/>
Default Jerk	10000.0	<input type="checkbox"/>

Collision avoidance State Model

Collision avoidance State Model

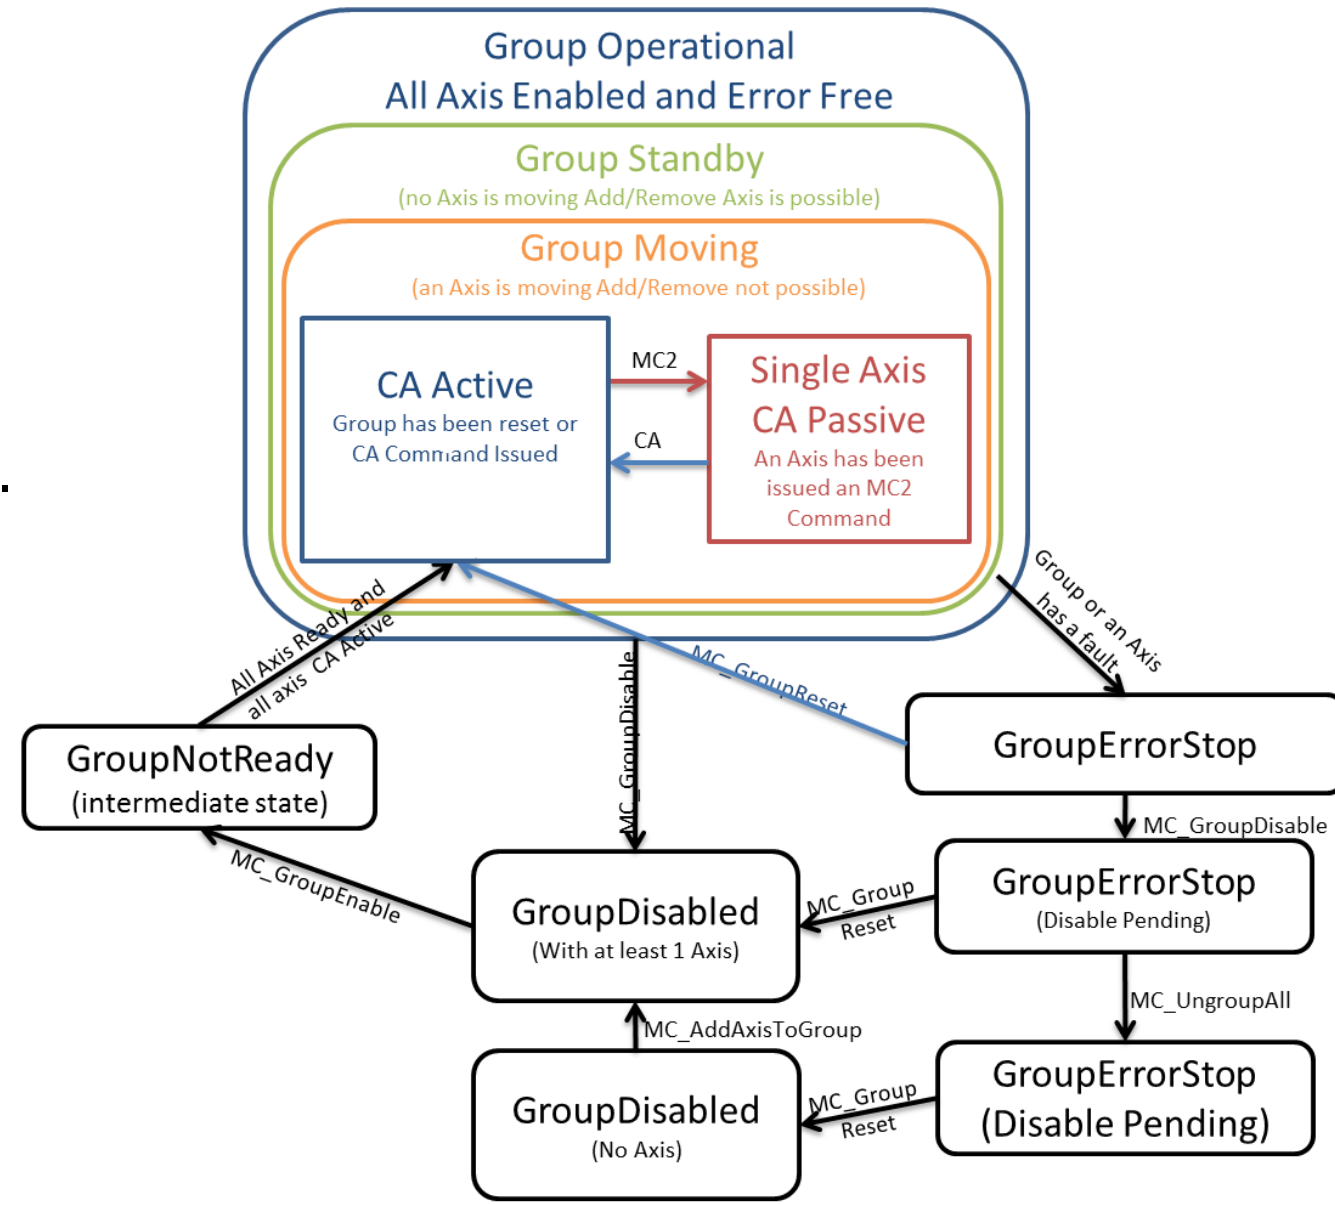

There are effectively 3 Group states that effect a Collision Avoidance axis.

1. Operational (Standby or Moving)
2. GroupErrorState (Faulted and Enabled, Faulted with Disable Pending, Faulted with Ungroup all pending)
3. Group Disabled (with at least 1 Axis or without any axis)

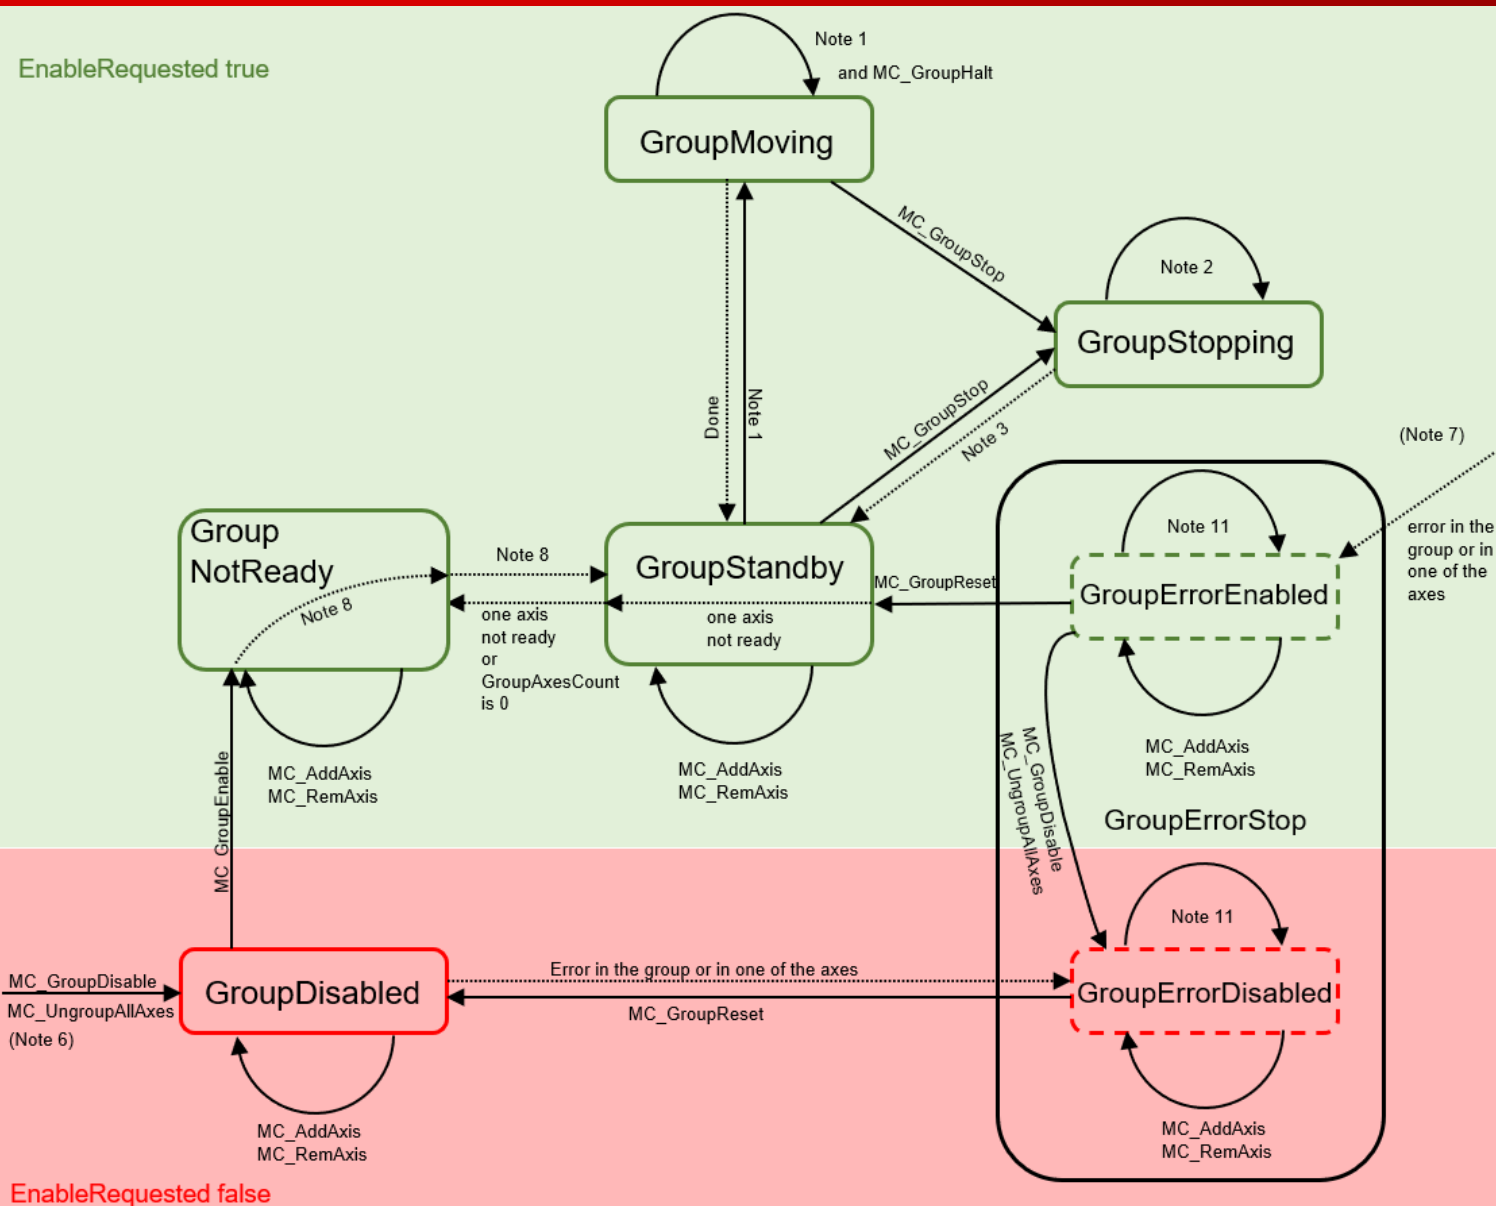

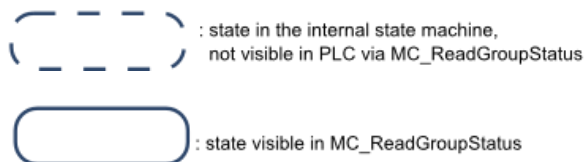

Collision Avoidance State Model

- A group without any axes is always disabled - it cannot be enabled.
- GroupNotReady is a short transitional state or waiting for axis to be enabled.
- GroupErrorState is a special state. The only method to leave this state is to issue a GroupReset.
- However, Group Reset will have different outcomes depending on the next requested or required state.

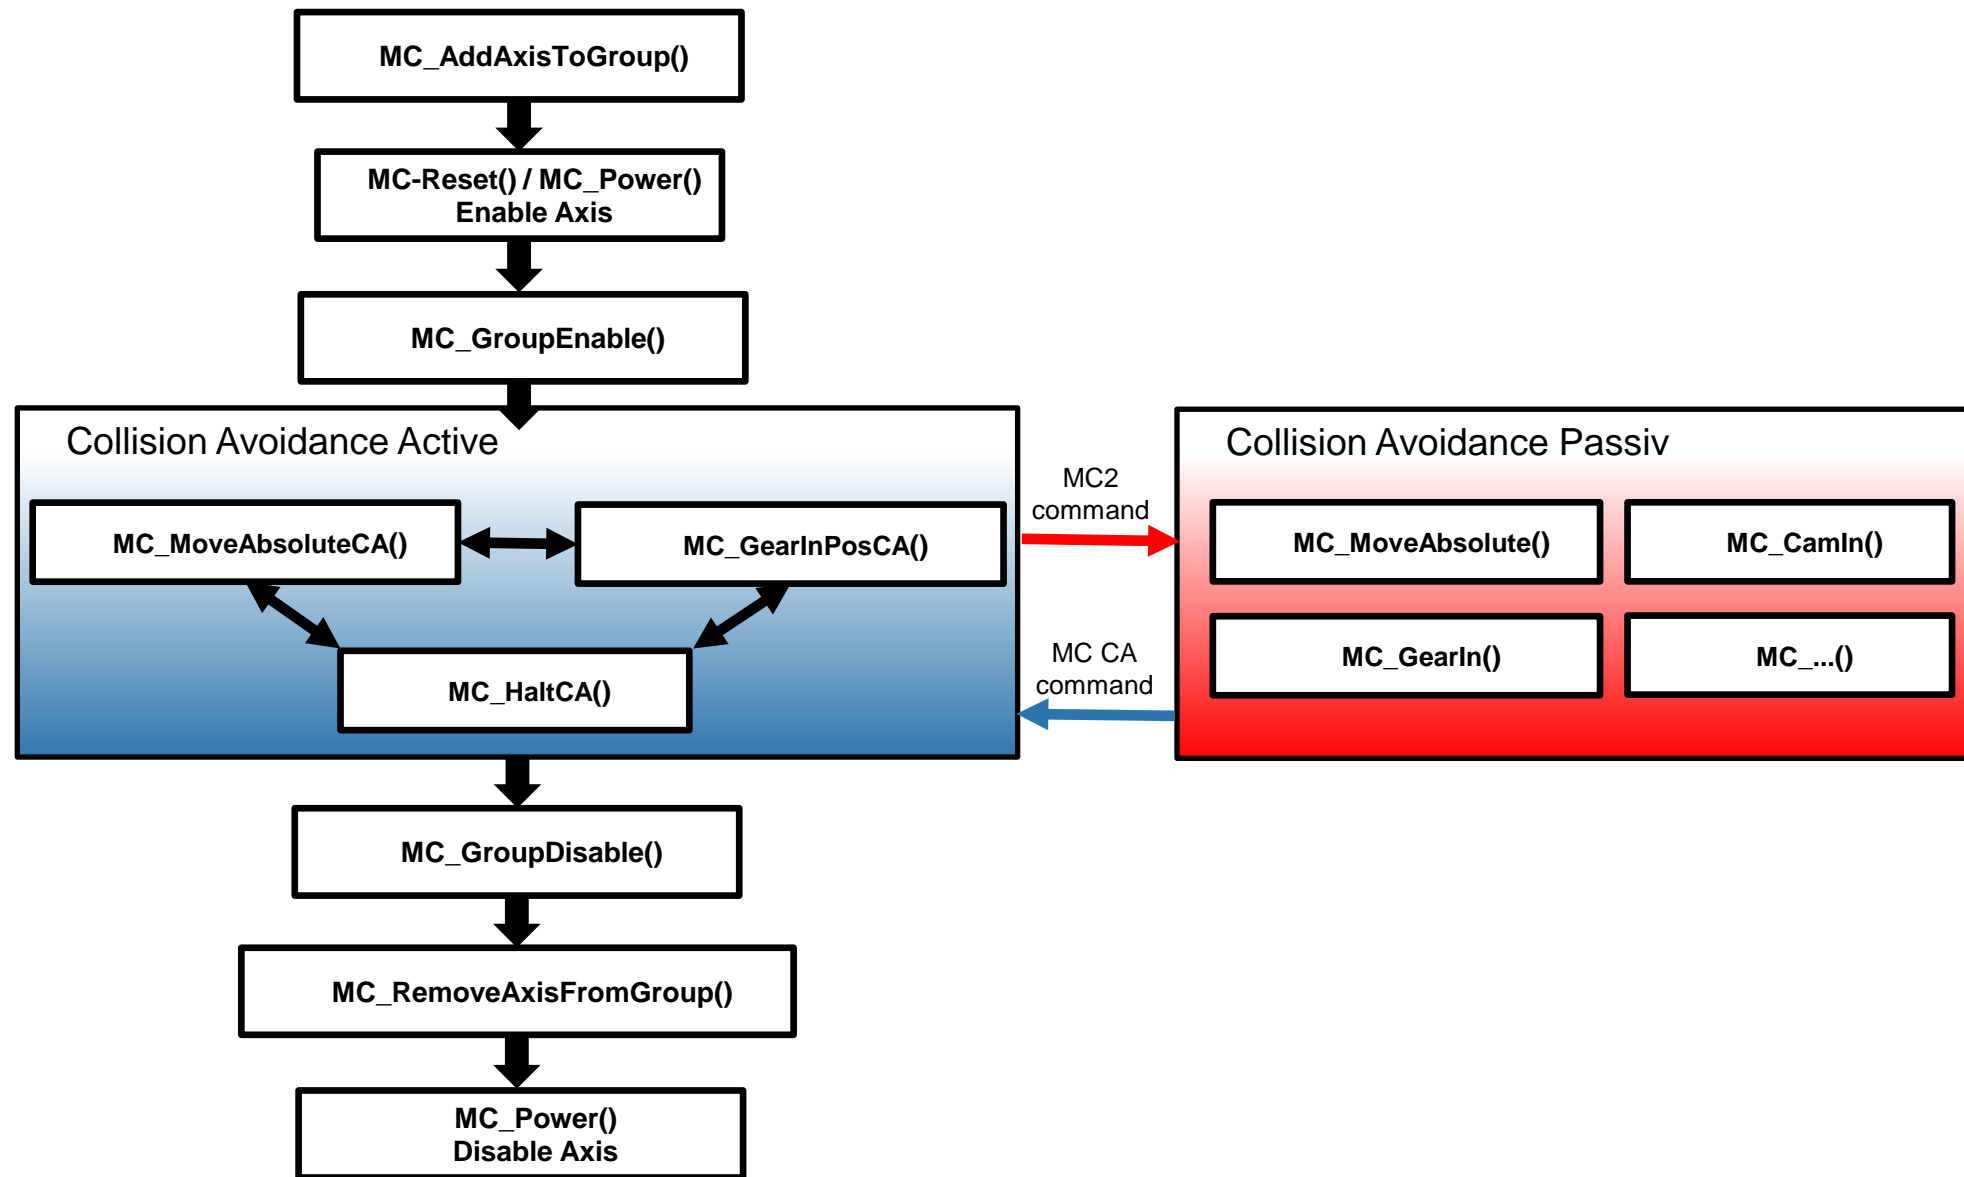

Collision Avoidance State Model

- simpler presentation
(State diagram valid for V3.1.10)

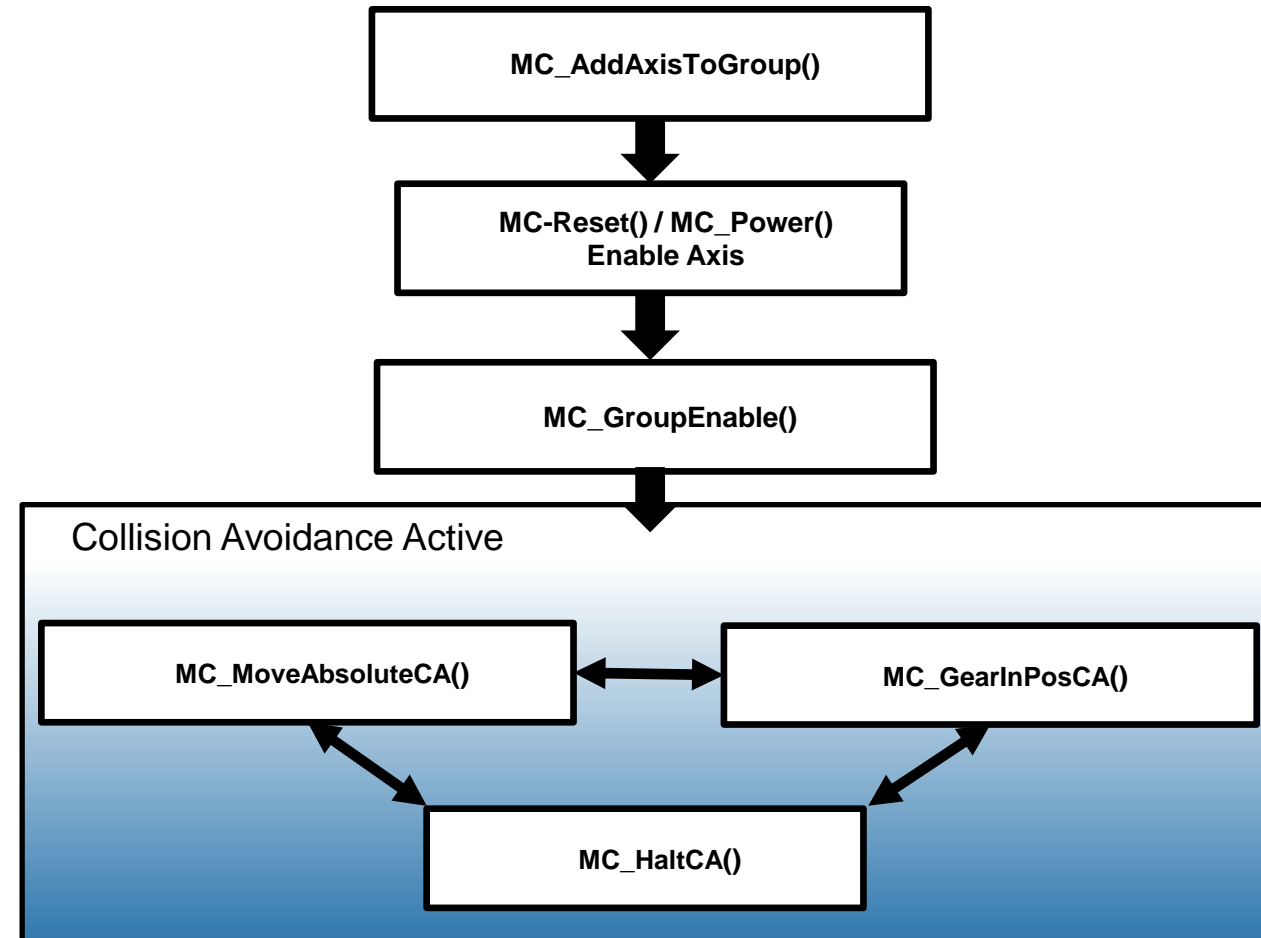

Full Sequence

Full Sequence

Startup Sequence:

1. Add All Axes to the group
2. Reset/Enable All axes
(ensure all axes are enabled
and error free)
3. Enable the Group

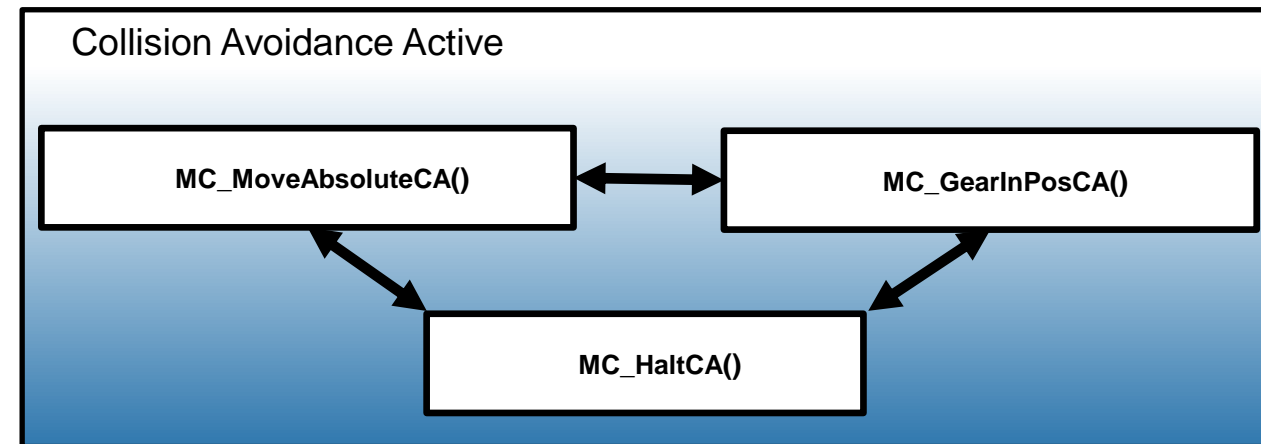

Full Sequence

Collision avoidance is active :

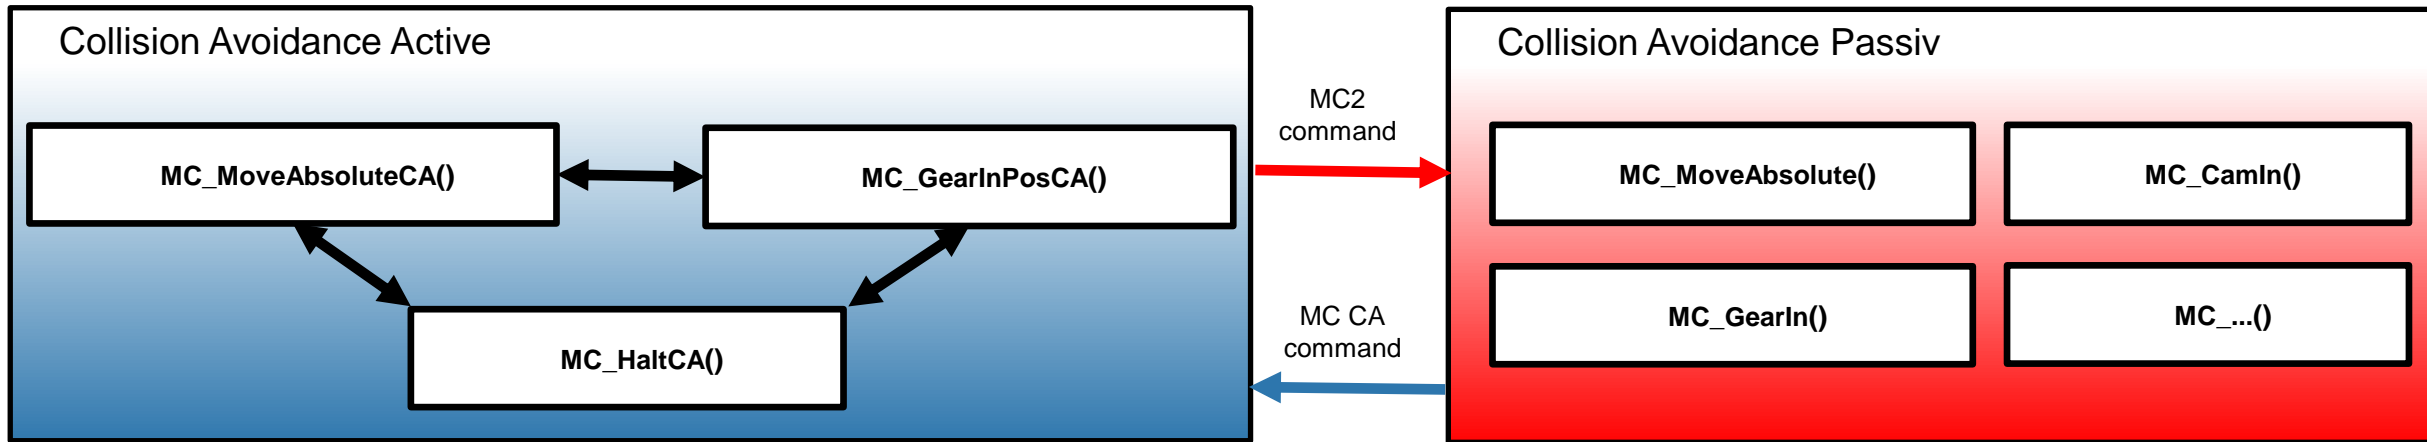

If Standby Gap is active the movers will separate

Should a failure occur, GroupReset will return the system to the running state

Full Sequence

- By using a MC2-Command the axis change in “CA-Passiv”

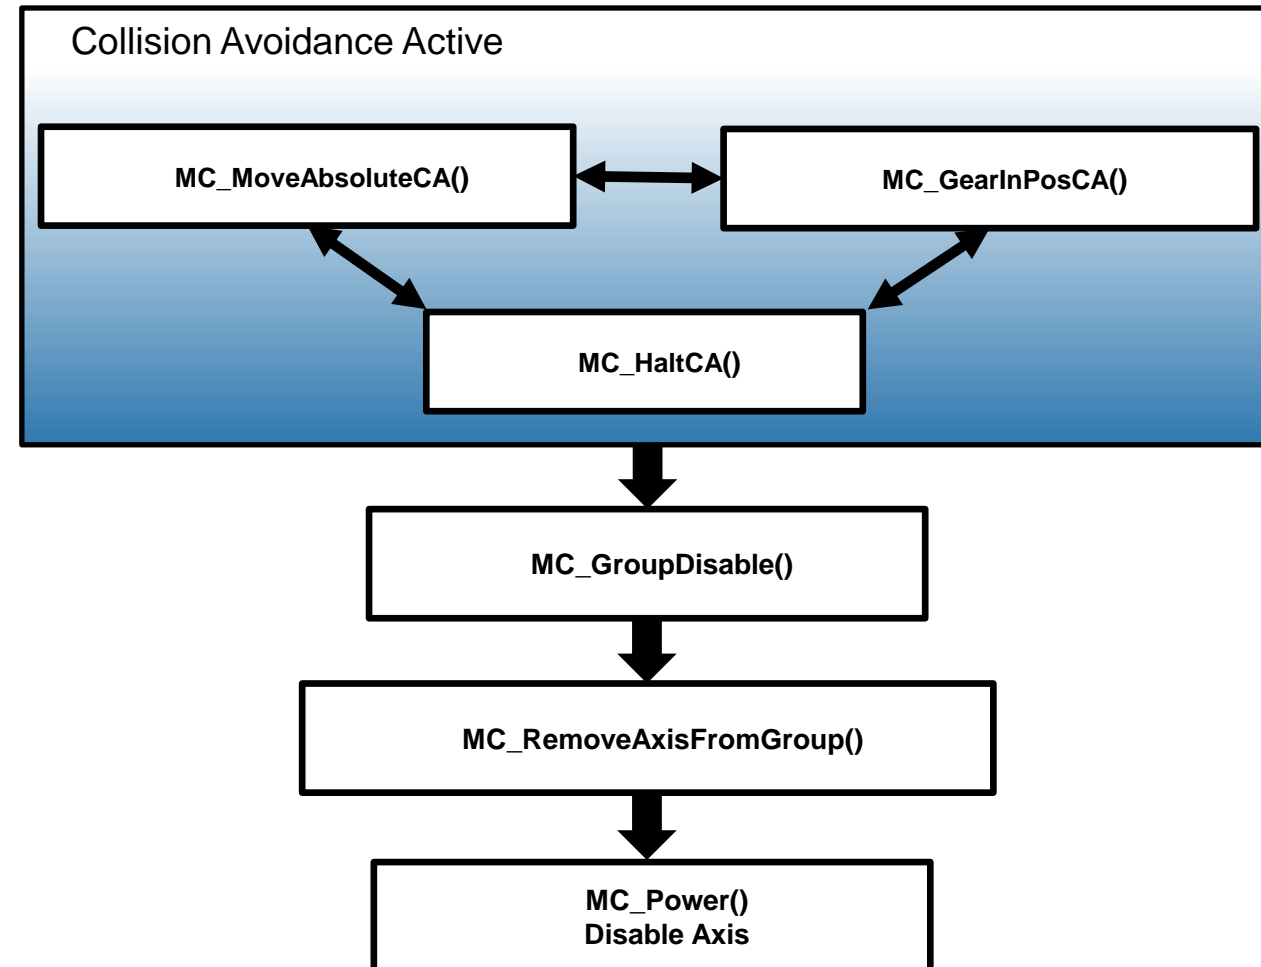

- With using a MC_CA-Command the Axis change in “CA-Active”

Full Sequence

Reset or Shutdown Sequence:

Halt-Command for all Movers

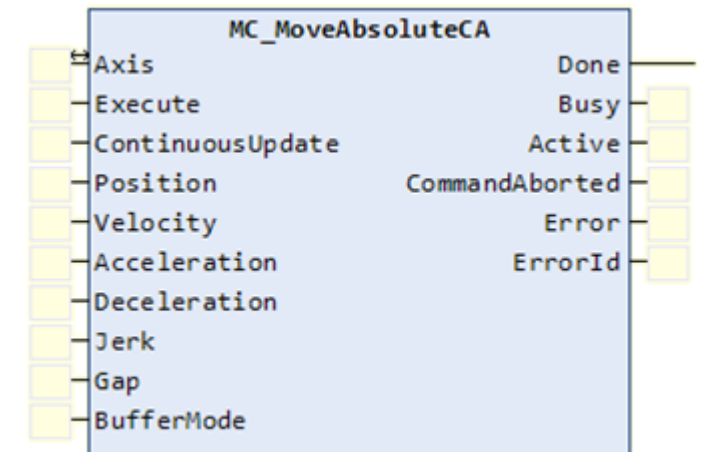

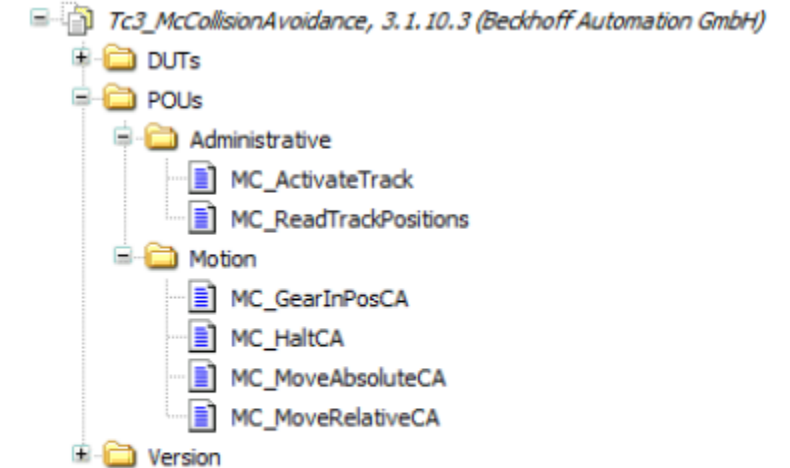

1. Disable Group
2. Remove all Axes from Group
3. Disable Axes

- **MC_MoveAbsoluteCA**
Moves a single axis to an absolute position with collision avoidance.
- **MC_MoveRelativeCA**
Moves a single axis over a relative distance with collision avoidance.
- **MC_HaltCA**
Stops a single axis with collision avoidance without locking it for further motion commands.
- **MC_GearInPosCA**
Couples a slave axis with a gearing factor and collision avoidance to a master axis.

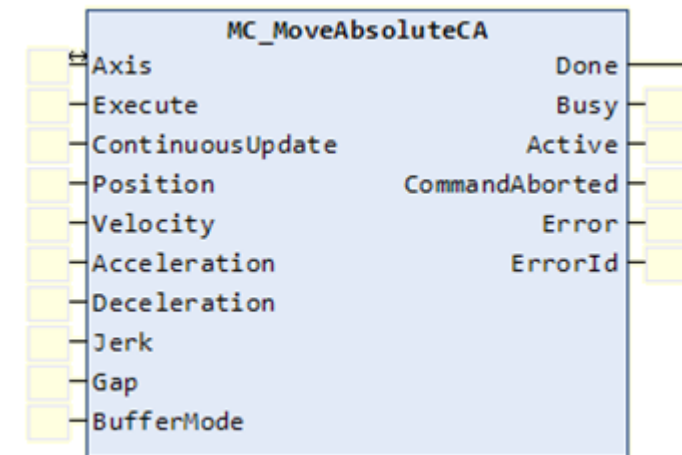

MC_MoveAbsoluteCA

This function block commands the specified mover to the specified absolute position according to the parameterized gap of the collision avoidance input.

The collision avoidance functionality has higher priority than the absolute motion command.

During execution of the move, the axis may slow down or stop and wait to avoid a collision. The axis will prioritize maintaining the gap overreaching the destination position. When the path is clear the axis will complete the absolute position command.

The Done output of the function block will become True when the target position has been reached.

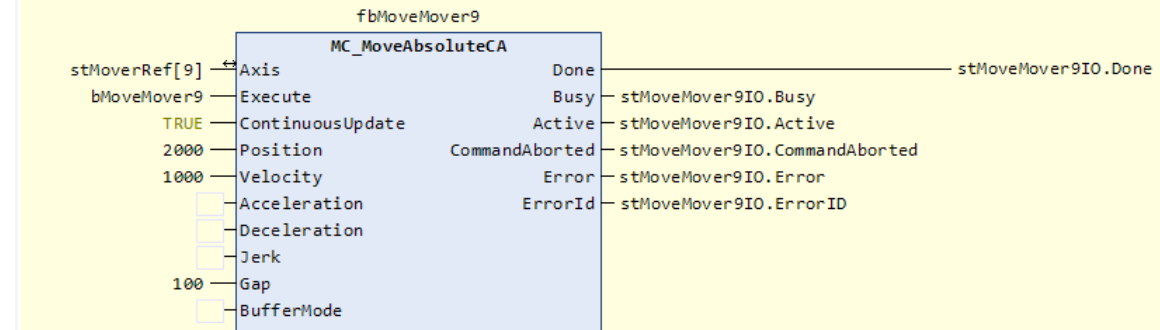

MC_MoveAbsoluteCA

Mover 9 is free to move towards the target position of 2000 with a velocity of 1000.

Once the target position is reached, Done becomes True and Busy and Active become False.

The move has been completed successfully and mover 9 is now at position 2000.

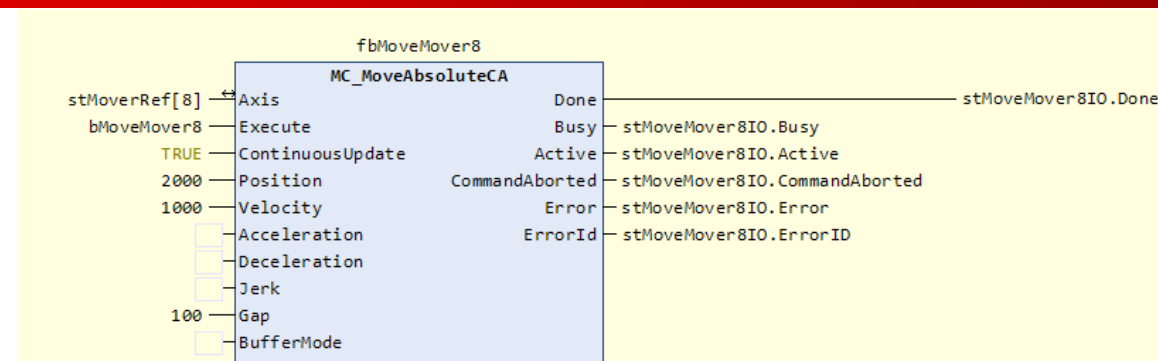

MC_MoveAbsoluteCA

Mover 8 is commanded to move to the same position as Mover 9; however, Mover 9 is in the way. Collision Avoidance will prevent Mover 8 from reaching position 2000 but it will also prevent Mover 8 from colliding with Mover 9.

The profile of Mover 8 will look as follows.

Mover 8 stops to maintain the gap spacing but the Active bit and the Busy bit remain true and Done remains false.

This move is not complete.

MC_MoveAbsoluteCA

Mover 9 is free to move towards the target position of 2500 with a velocity of 1000.

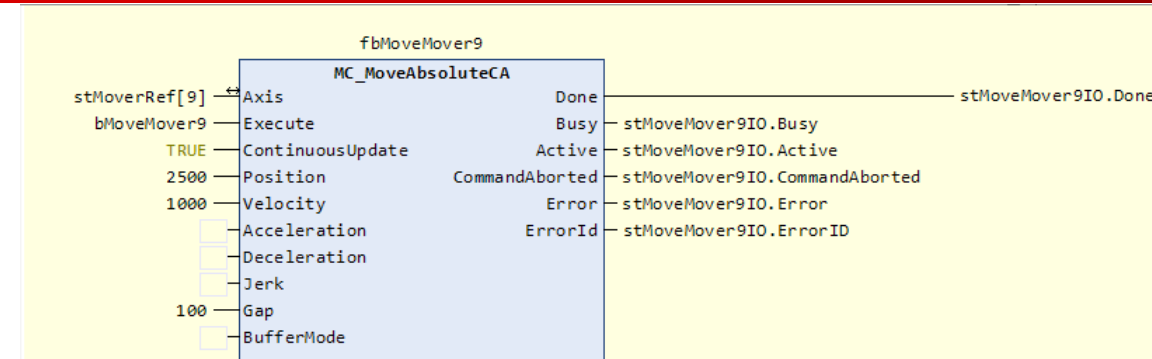

Mover 9 starts to move out of the way.

Mover 8 begins to move, ramps up its velocity and then stops in its final target position, “2000”.

Mover 8’s Busy and Active bits become false and the done bit for Mover 8 is set.

Mover 8’s mover is now complete.

Then finally mover 9 completes its commanded move.

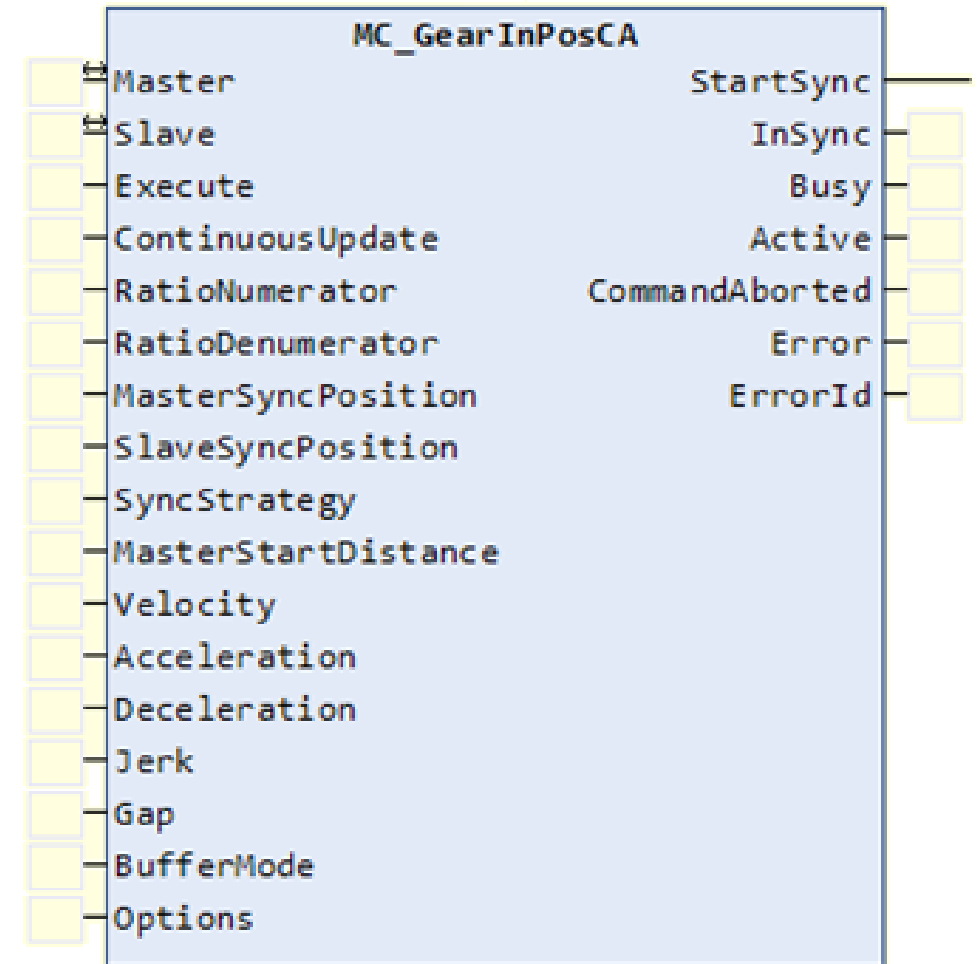

MC_GearInPosCA

This function block couples a slave axis to a master axis.

The set values for both axes are calculated based on the master axis set values.

Like all collision avoidance commands, priority is given to satisfying collision avoidance.

Completion of the commanded move occurs when there is no possibility of striking another axis or violating the collision avoidance gap.

MC_GearInPosCA

A typical use for the MC_GearInPosCA block is to synchronize a mover to a product on a conveyor. To accomplish this, the conveyor is equipped with a servo motor or encoder and a sensor is used to mark positions of products on the conveyor.

In all cases, Gap control overrides the move command, if the mover would approach another axis, it will slow down regardless of the command issued.

MC_GearInPosCA

Input „SyncStrategy“
from Type MC_SYNC_STRATEGY

This data type defines the synchronization
profile of the slave

TYPE MC_SYNC_STRATEGY

mcSyncStrategyLate	16#1
mcSyncStrategySlow	16#2
mcSyncStrategyEarly	16#3

MC_GearInPosCA

mcSyncStrategyLate

The slave starts the synchronization as late as possible and with full dynamics (according to the input values velocity, acceleration, deceleration, jerk).

It reaches the SlaveSyncPosition just in time with the correct gear ratio.

MC_GearInPosCA

mcSyncStrategySlow

The slave starts its sync in motion as soon as the master passes the MasterStartDist (MasterSyncPosition - MasterStartDistance). If the MasterStartDist is not set then the motion begins as soon as the FB is Active.

The dynamics of the slave are reduced such that the slave reaches the SlaveSyncPos with the correct gear ratio just in time when the master reaches the MasterSyncPos.

MC_GearInPosCA

mcSyncStrategyEarly

The slave starts its motion as soon as the master passes the MasterStartDist. If the MasterStartDist is not set then the motion begins as soon as the FB is Active.

The dynamics are not reduced.

The slave signals earlier InSync than demanded by the SlaveSyncPosition, but it is still guaranteed that the demanded offset between master and slave ($\text{MasterSyncPosition} - \text{SlaveSyncPosition}$) is reached with the correct gear ratio.
